Initial Post and Discussion Summary

The Impact of AI Writing on Administrative and Creative Domains

As Hutson (2021) argues, a confident-sounding output from a large language model (LLM) does not reflect its genuine comprehension. Zhang *et al. (*2026) note that technological progress has shifted from early reasoning systems to advanced reasoning-augmented LLMs. These newer models can now present their problem-solving more clearly and confidently. However, this evolution does not answer whether Artificial Intelligence (AI) truly comprehends what it writes. It further intensifies the debate about whether these models truly understand or possess consciousness.

Nowadays, AI writers span a wide range of domains, supporting administrative and creative work. Individuals and organisations benefit from AI support for tasks such as drafting emails, writing reports, summarising meetings, and synthesising documents. Noy and Zhang (2023) confirm that leveraging AI reduces time spent on tasks while improving output quality. Similarly, Jimenez (2025) highlights that AI use drives efficiency and productivity gains. However, Thomas, Romasanta and Priego (2026) caution that reliance on AI writers increases risk, especially when work shifts from simple, low-stakes, template-based tasks to more analytical ones. The model may apply knowledge inconsistently. These models can lead to unpredictable performance and inaccuracies that are even harder to catch, especially in specialised, more complex outputs like legal and medical reports. Moreover, this unpredictability can compromise data security and can lead to confidential data leaks and breaches of proprietary information.

At the other end of the spectrum is creative writing, encompassing novelists, songwriters, poets, and marketers seeking powerful creative advantages. In this realm, AI writers can reduce creative blocks and enable rapid, versatile prototyping. Doshi and Hauser (2024) observe that AI-generated writing is often perceived as well-composed and engaging. Nevertheless, it risks degrading collective originality by producing only average output. While LLMs aim to minimise uncertainty, Sui (2026) argues that true human creativity is rooted in ambiguity, which can foster abundant original work and help prevent copyright infringements and legal disputes.

Ultimately, Bellaiche *et al.* (2023) underscore that human creative output is more valued than AI-generated content, indicating that final assessment depends on the reviewer's nuanced interpretation and judgment, rather than word matching alone.

Whether AI is used for administrative or creative writing, the foundation remains the same. AI relies on next-word prediction, grounded in mathematical formulas, without true understanding of a single word or a work's context. While it can produce a creative marketing campaign, it can also support radical text. The models lack real comprehension or emotional investment, which highlights the crucial need for meaningful human oversight to verify and catch errors. Regardless of AI's evolutionary progress, humans must act as ethical guardians, bearing accountability and responsibility. They must carefully evaluate the emotional and societal impacts of administrative and creative outputs, provide informed guidance, and govern deployment decisions.

Discussion Summary

AI Writing: From Confident-Sounding Fluency to Reliability

My initial post examined AI's impact on administrative and creative writing, considering both the benefits and risks of using LLM support. According to Hutson (2021), while LLMs can produce fluent text, this does not guarantee comprehension. As these technologies advance and mistakes become harder to detect, the human-in-the-loop role becomes even more critical.

Peer feedback reinforced the paradox of model confidence without true understanding. The module learnings emphasised that artificial neural networks learn from prediction errors. Backpropagation and optimisation reduce loss and improve performance, while the confidence score simply reflects the model's preference among possible options (Géron, 2022). However, neither ensures correctness or truthfulness. My experiments with Transformers confirmed that access to context does not automatically guarantee accurate interpretation or factual accuracy.

Moreover, AI-generated creative writing does not warrant uniqueness or cultural awareness, but tends to favour familiar patterns from its training data. As peer feedback emphasised, this can erase linguistic and cultural nuances (Agarwal, Naaman and Vashistha, 2025) and can lead to less varied output (Doshi and Hauser, 2024). Metrics like BLEU and ROUGE help assess text correctness by matching against a reference, while perplexity evaluates next-token prediction. However, these measures do not capture originality or cultural expression. As Schmidtová *et al.* (2024) note, evaluating generated text requires carefully selecting metrics that align with culturally nuanced human judgments.

Finally, peer feedback underscored the need to clearly define human oversight, especially in high-stakes domains where complex administrative tasks are more prone to AI inaccuracies (Thomas, Romasanta, and Priego, 2026). Institutions and decision-makers should set clear boundaries for what information enters LLMs and ensure output quality by verifying results against the source of truth.

Overall, this discussion clarified that, regardless of task or complexity, outputs should be evaluated with appropriate metrics, assessed in context and fact-checked, and reviewed for potential harm. Confidence, fluency, or architectural advances alone do not guarantee reliability.
